Hi Pramuk,

I have provided you with some feedback on your project. You can read it below:

**Overview:**

The overall security of student housing at uni is quite lacking. Currently, to improve on this, one can buy a CCTV camera or a lock for the door. The goal of your project is to develop a solution that is not just better than these previously mentioned ones but also more informative. This solution of yours will provide your room with extra security in the form of a motion detection system. When the system is activated, a Particle Argon will continuously record data from the motion sensor. At anytime movement is detected in your room, the Argon will send an IFTTT trigger to your phone to notify you that someone is inside.

**Positives:**

The solution design for this problem has some great ideas, including the ones for future improvements. It will be useful to know when one of your roommates is home the minute they step into the room.

I was able to understand the objective of your project very well as the idea does make sense and works well from a security perspective.

**Negatives:**

I had issues understanding your living conditions. Are you living in a dorm with roommates on-campus or in student accommodation outside the campus with roommates/on your own? This would have been more helpful in understanding how the security system could work.

Hope this feedback is helpful for you.

Regards,

Ben Marriner

Hey Sarah,

I have written some feedback for your project. You can find it below:

**Overview:**

Your project aims to solve a few problems instead of just one. The first being saving on electricity by having lights automatically switch on and off. The second is having a light switch on in the front yard when someone arrives home at night so they can see what they are doing. Third, provide a solution that is relatively inexpensive compared to current surveillance solutions. Fourth, the common problem when living with roommates and relying on someone to be home to unlock the door for you. The last problem is visitors not ringing the doorbell before entering the house.

**Positives:**

This system seems to really elaborate, which would have required you to go into a lot of detail to explain how it will work. You did just that. I have a complete understanding of how the system will work thanks to the diagrams and equipment that was listed in the tools slide.

**Negatives:**

The presentation had some really good ideas, so I can't really think of any real negatives. The only minor problem I found was understanding what you were saying since your laptop's microphone made you sound like an astronaut. Apart from that, everything else was pretty good.

Hope my feedback helps.

Regards,

Ben
